WMS Project Preparation Brief

Prepared 2026-10-20 | Your warehouse project at a glance

Executive summary

Customer project preparation: Ready for detailed evaluation. This describes your implementation preparation; Quark core WMS operations are implemented.

Business profile	Your stated position
Primary industry	General Distribution
Operating models	3PL / Contract Logistics
Warehouse footprint	1 warehouse
Active users	12 active users
Daily volume	250 orders per day
Current systems	Paper / spreadsheets / manual processes; ERP: No ERP in use

Your top 3 actions

1. Clarify the planned ERP connection despite no ERP today

Confirm the intended scope and which statement applies to each workflow/site.

Why: These reported choices may need reconciliation; neither answer is silently overwritten.

2. Validate client-specific acceptance scenarios

Ask operations/commercial owners which separation, billing, label/report and interface requirements actually apply. Compare representative clients and agree acceptance tests.

Why: The user explicitly selected client requirements; no billing/isolation functionality is assumed.

3. Build an interface validation sheet

List messages/files/APIs, trigger conditions, frequency and source/target owners. Define retry, idempotency, reconciliation and failed-message acceptance tests with IT.

Why: External connection categories were selected; category/count alone does not establish effort.

Customer preparation brief. Specialist fit, certification, costs and rollout are scoped separately.

Complexity and readiness

Operational scope and implementation preparation are assessed independently.

Operational complexity factors

Dimension	Stated factors and open questions
Process Variability	Process variation: One broadly consistent set of processes; Client variation: Broadly identical processes
Inventory & Traceability	Tracking: Quantity only; Ownership: Multiple owners / depositors; Units: A single handling unit
Integrations	Connections: ERP, Customer / partner EDI; Exchange: Event / API messages; Owners: Agreed and assigned; Recovery: Agreed and assigned
Automation	RF/mobile: Not currently used or planned; Equipment: No automation in scope
Multi-owner Operations	Ownership: Multiple owners / depositors; Depositors: 20; Client variation: Broadly identical processes; Client rules: Inventory / access separation, Client billing rules, Client-specific reports
Deployment Replicability	Sites: 1

Not assessed from these answers: Compliance. No requirement is inferred.

Implementation readiness: Ready for detailed evaluation

Preparation area	Your stated preparation
Master data	Available, reviewed and consistent
Requirements	Documented and agreed with process owners
Project owner	An owner is assigned with time allocated
Budget basis	A planning basis and decision process are agreed
Operations and IT	Agreed and assigned
Interface owners	Agreed and assigned
Acceptance tests	Agreed and assigned
Target window	Considering a start in 6-12 months

Unknown answers are open questions, not failed checks. Scale, industry and complexity do not lower this readiness result. Full answers follow in the appendix.

Preparation and discovery

Use the following items to prepare an internal project meeting or supplier discussion.

Requirements you explicitly reported

These are your stated requirements. Specialist rules and connections need project-specific validation.

Requirement	Your answer
Required tracking	Quantity only
Units of measure	A single handling unit
Required integration categories	ERP, Customer / partner EDI
Requirements to validate	Inventory / access separation, Client billing rules, Client-specific reports

Discovery topics to validate

Your industry and operating model select these topics. They do not establish applicable regulations, mandatory features or supplier compatibility.

Topic for discussion	Why it was selected
Which client-specific rules need evaluation?	Operating models: 3PL / Contract Logistics; Inventory ownership: Multiple owners / depositors
How will interfaces be owned and recovered?	Required integration categories: ERP, Customer / partner EDI

Candidate supplier-evaluation scenarios

These scenarios support customer acceptance planning. Specialist requirements and connections are verified within the project scope.

Choose representative normal and exception cases with a process owner and validate with shortlisted suppliers.

Candidate scenario	Reason to evaluate it
Representative client rule and separation scenario	Client requirements were explicitly selected.
Receiving and putaway	These workflows are in the stated scope. Use a representative receipt and storage exception.
Picking and shipping evaluation	An outbound workflow is in scope; select a representative order and exception.

Candidate scenario	Reason to evaluate it
ERP integration validation	ERP connectivity is selected; define data ownership and an exchange/error-handling scenario.

Keep operational details within your organisation unless sharing is authorised. Contacting Quark is optional and never attaches this report automatically.

This brief assesses customer project preparation. Quark provides implemented core warehouse operations. User-reported requirements, specialist capabilities and external connections need project-specific validation. This is not compliance certification, a cost/ROI/effort estimate or go-live approval.

Appendix: your complete answers

Generated 2026-10-20T17:00:00.000Z | Taxonomy 0.1.0 | Rules 0.2.0 | JSON schema 2.0.0

Only questions in your active assessment path are included. Not specified means unknown, not no. Full answer-to-rule traceability remains in the structured JSON export.

Which industries does this warehouse serve?

Question detail	Your answer
Industries	General Distribution (primary)

How does the warehouse operate?

Question detail	Your answer
Operating models	3PL / Contract Logistics

What scale should the discussion cover?

Question detail	Your answer
Warehouses	1
Active warehouse users	12
Approximate daily volume	250
Volume unit	Orders per day

What inventory rules are actually required?

Question detail	Your answer
Required tracking	Quantity only
Inventory ownership	Multiple owners / depositors
Storage environment	Ambient
Order channel	B2B
Units of measure	A single handling unit

Which systems and floor technologies are in scope?

Question detail	Your answer
Current warehouse management	Paper / spreadsheets / manual processes
ERP presence	No ERP in use
Required integration categories	ERP, Customer / partner EDI
RF / mobile warehouse operations	Not currently used or planned
Automation equipment in use or planned	No automation in scope

Which workflows, variations and problems matter?

Question detail	Your answer
Warehouse workflows	Receiving, Putaway, Picking, Shipping
Process variations	One broadly consistent set of processes
Important operational problems	No specific problem identified yet

What is prepared for a supplier evaluation?

Question detail	Your answer
SKU and location master data	Available, reviewed and consistent
Operational requirements	Documented and agreed with process owners
Internal project owner	An owner is assigned with time allocated
Budget readiness	A planning basis and decision process are agreed
Intended implementation horizon	Considering a start in 6-12 months
Operations and IT stakeholders	Agreed and assigned
Integration ownership and contacts	Agreed and assigned

Question detail	Your answer
Representative tests and exception scenarios	Agreed and assigned

Which client-specific rules need evaluation?

Question detail	Your answer
Approximate depositors / inventory owners	20
Cross-client process variation	Broadly identical processes
Requirements to validate	Inventory / access separation, Client billing rules, Client-specific reports

How will interfaces be owned and recovered?

Question detail	Your answer
Expected exchange pattern	Event / API messages
System / interface ownership	Agreed and assigned
Failed-message recovery and reconciliation	Agreed and assigned
